

# Deep Reinforcement Learning based QoS aware secure routing in SDN-IoT

Aluri Jagan Mohini

University of Paderborn

31-5-2020

# Outline

- 1 Introduction
- 2 Packet forwarding in Traditional protocol vs proposed DQSP
- 3 DDPG (Deep Deterministic Policy Gradient) algorithm
- 4 Results
- 5 Conclusion
- 6 References

# Introduction

- Internet of Things (IoT).
- Why SDN-IoT ?

# Packet forwarding in Traditional protocol vs proposed DQSP

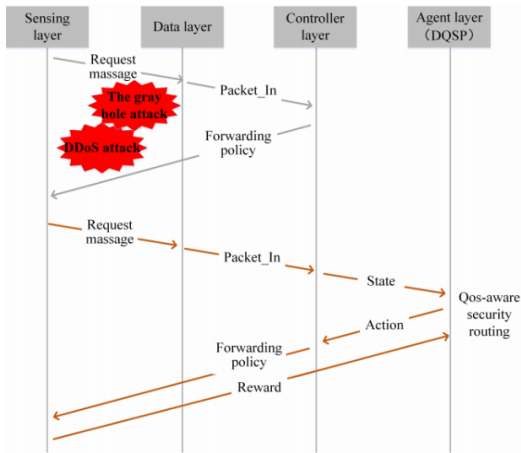

Figure 1: Workflow of traditional vs DQSP [Guo+19].

# Basic Definitions

- State
- Action
- Reward

$$R(t) = \frac{1}{|M|} \sum_{i \in M} (\alpha R_{v_i}^{attack}(t) + \beta R_{v_i}^{qos}(t)) \quad (1)$$

# DDPG algorithm(Deep Deterministic Policy Gradient)

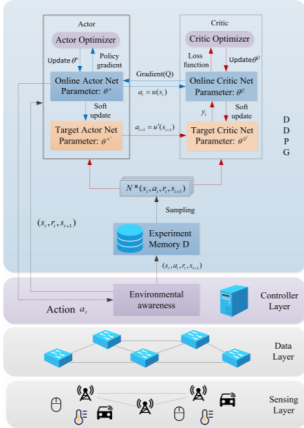

Figure 2: DDPG process in a DQSP Architecture [Guo+19].

- Experimental Setup
  - Tensor flow.
  - A network with 10 switch nodes.
  - Training process involved 300 episodes.

# Training Episode

Figure 3: Total Rewards obtained by training episode [Guo+19].

# Evaluation

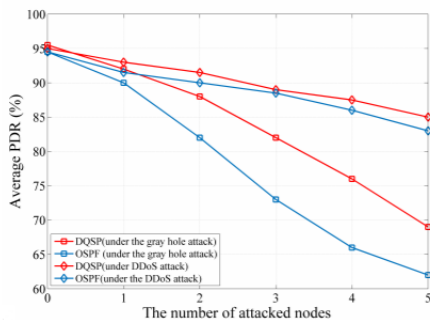

Figure 4: PDR and End to End delay in an attacked environment [Guo+19].

# Conclusion

- DQSP is capable of creating secure routing strategies with DDPG.
- It contributed to the overall QoS of network.
